THERMAL CHARACTERIZATION OF POLYMERIC MATERIALS

EDITED BY EDITH A. TURI, Allied Corporation

This valuable book offers expertise in every area of polymer characterization by thermal analysis. The chapters, by distinguished authors, systematically review: • the instrumentation and basic principles of thermal analysis • the scientific background underlying practical applications of thermal analytical techniques • a diversified selection of practical examples for problem solving

The volume also examines such nonthermal methods as microscopy and x-ray diffraction. **Includes references to 1981.**

EMULSION POLYMERIZATION

EDITED BY IRJA PIIRMA

This comprehensive volume presents the theory and practice of emulsion polymerization and covers recent advances in this important field of polymer science. The chapters, by recognized authorities on polymer colloids, provide in-depth coverage of emulsion formation, stability, and industrial practices. Some topics discussed include: • stability and instability of polymer lattices • particle formation mechanisms • theory of kinetics of compartmentalized free-radical polymerization reactions • effects of the choice of emulsifier in emulsion polymerization • recent developments and trends in the industrial use of latex • effects of additives on the formation of monomer emulsions and polymer dispersions • radiation-induced emulsion polymerization

MULTIPHASE FLOW IN POLYMER PROCESSING

CHANG DAE HAN

In this book Dr. Han examines the rheological behavior of multiphase (or multicomponent) polymeric systems involved in various fabrication processes. In Part I he covers the rheological behavior of particulate-filled polymeric systems and heterogeneous polymeric systems, droplet breakup in dispersed flow, and gas-charged polymeric systems. These chapters consider the role of the discrete phase (i.e., solid particles, liquid droplets, and gas bubbles) in determining the bulk rheological properties of the multiphase system. They also discuss some representative polymer processing operations of the multiphase polymeric systems. Part II contains two chapters that treat coextrusion processes of industrial importance, including bicomponent fiber spinning, multilayer film extrusion, wire coating coextrusion, and interfacial instability in coextrusion. The chapters emphasize a unified approach to the study of coextrusion processes from the rheological perspective.
